Textcomment A comment word
dup Execute word
8 Number puts the number on the stack
dup Compile. If there is a macro named dup, then execute it. If not, then compile a call to the forth word dup.
88 Literalcompile compiles code that puts 88 on the stack at run time. This is the equivalent of the traditional forth's: 88 literal
dup Macrocompile compiles a call to a macro.
dup Addresscompile compiles code that puts the address of dup on the stack at run time. This is the traditional forth's: 'dup literal
This is a string Stringcompile compiles code that puts the address of the defined counted string on the stack at run time.
Tab and Newline are formatting tags
Define defines a forth word
Variable creates a forth variable. A forth variable when executed puts the address of the variable on the stack. When compiled, a forth variable puts the address of the variable on the stack at run time.
